## 2024\_28\_III\_OOPS Using Java Lab

### REC\_2028\_OOPS using Java\_Week 3\_CY

Attempt : 1  
Total Mark : 40  
Marks Obtained : 40

#### Section 1 : Coding

##### 1. Problem Statement

Alex is a treasure hunter who collects valuable items during their quests. Each item has a specific point value, and Alex wants to maximize their score by strategically removing items one at a time.

The rule is simple: Alex removes the item with the highest point value in each step until no items are left, summing the values of the removed items to calculate the maximum score.

Help Alex to complete his task.

##### ***Input Format***

The first line of input consists of an integer N, representing the size of the array.

The second line of input consists of N space-separated integers, representing the point values of the items.

### ***Output Format***

The output prints "Maximum Sum: " followed by the calculated maximum score after removing all items.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 14

7 14 21 28 35 42 49 56 63 70 77 84 91 98

Output: Maximum Sum: 735

### ***Answer***

```
import java.util.Scanner;
import java.util.Arrays;

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int N = sc.nextInt();
        int[] items = new int[N];
        for (int i = 0; i < N; i++) {
            items[i] = sc.nextInt();
        }
        Arrays.sort(items);
        int sum = 0;
        for (int i = N - 1; i >= 0; i--) {
            sum += items[i];
        }
        System.out.print("Maximum Sum: " + sum);
        sc.close();
    }
}
```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement:

Imagine you have an array of integer values, and you're tasked with identifying a pair of elements within the array. This pair of elements should have a sum that is the closest to zero when compared to any other pair in the array.

Your goal is to create a program that solves this problem efficiently. The program should accept an array of integers and return the pair of elements whose sum is closest to zero.

### ***Input Format***

The first line of the input is an integer N representing the size of the array.

The second line of the input contains N space-separated integer values.

### ***Output Format***

The output is displayed in the following format:

"Pair with the sum closest to zero: {value} and {value}"

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 5

9 10 -3 -5 -2

Output: Pair with the sum closest to zero: 9 and -5

### ***Answer***

```
import java.util.Scanner;  
import java.util.Arrays;
```

```
class Solution {  
    public static void main(String args[]) {  
        Scanner sc = new Scanner(System.in);  
        int n = sc.nextInt();  
        int[] arr = new int[n];
```

```

for (int i = 0; i < n; i++) {
    arr[i] = sc.nextInt();
}

int minSum = Integer.MAX_VALUE;
int firstElement = 0;
int secondElement = 0;

for (int i = 0; i < n - 1; i++) {
    for (int j = i + 1; j < n; j++) {
        int sum = arr[i] + arr[j];
        if (Math.abs(sum) < Math.abs(minSum)) {
            minSum = sum;
            firstElement = arr[i];
            secondElement = arr[j];
        }
    }
}

System.out.println("Pair with the sum closest to zero: " + firstElement + " and "
+ secondElement);
sc.close();
}
}

```

**Status :** Correct

**Marks :** 10/10

### 3. Problem Statement

Rina is managing the inventory for a library, where each row of a 2D matrix represents the number of different genres of books available on each shelf.

She wants to perform the following operations:

**Transformation:** Replace each element in a row with the sum of all elements in that row.  
**Merging:** After transformation, Rina will provide one additional matrix, and specify whether to merge the transformed matrix with this new matrix row-wise or column-wise.

### ***Input Format***

The first line contains two integers R and C, representing the number of rows and columns of the initial matrix.

The next R lines contain C space-separated integers, representing the book counts in the library.

The next line contains two integers MR and MC, representing the dimensions of the second matrix (to be merged).

The next MR lines contain MC space-separated integers, representing the second matrix.

The last line contains an integer mergeType:

- 0 Row-wise merging (append the second matrix below the transformed matrix).
- 1 Column-wise merging (append the second matrix to the right of the transformed matrix).

### ***Output Format***

The output prints "Transformed matrix: " followed by the transformed 2D matrix where each element in a row is replaced with the sum of the elements in that row.

The output prints "Final merged matrix: ", followed by the merging based on mergeType.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 3 4

8 2 4 9

4 5 6 1

7 8 9 3

2 4

3 5 7 2

6 1 4 9

0

Output: Transformed matrix:

23 23 23 23

16 16 16 16

27 27 27 27

Final merged matrix:

23 23 23 23

16 16 16 16

27 27 27 27

3 5 7 2

6 1 4 9

**Answer**

```
import java.util.Scanner;
```

```
public class Main {  
    public static void main(String[] args) {  
        Scanner sc = new Scanner(System.in);
```

```
        int R = sc.nextInt();  
        int C = sc.nextInt();  
        int[][] matrix = new int[R][C];
```

```
        for (int i = 0; i < R; i++) {  
            for (int j = 0; j < C; j++) {  
                matrix[i][j] = sc.nextInt();  
            }  
        }
```

```
        int MR = sc.nextInt();  
        int MC = sc.nextInt();  
        int[][] second = new int[MR][MC];
```

```
        for (int i = 0; i < MR; i++) {  
            for (int j = 0; j < MC; j++) {  
                second[i][j] = sc.nextInt();  
            }  
        }
```

```
        int type = sc.nextInt();
```

```
        int[][] transformed = new int[R][C];
```

```

for (int i = 0; i < R; i++) {
    int sum = 0;
    for (int j = 0; j < C; j++) {
        sum += matrix[i][j];
    }
    for (int j = 0; j < C; j++) {
        transformed[i][j] = sum;
    }
}

```

```

System.out.println("Transformed matrix:");
for (int i = 0; i < R; i++) {
    for (int j = 0; j < C; j++) {
        System.out.print(transformed[i][j] + " ");
    }
    System.out.println();
}

```

```

System.out.println("Final merged matrix:");
if (type == 0) {
    for (int i = 0; i < R; i++) {
        for (int j = 0; j < C; j++) {
            System.out.print(transformed[i][j] + " ");
        }
        System.out.println();
    }
    for (int i = 0; i < MR; i++) {
        for (int j = 0; j < MC; j++) {
            System.out.print(second[i][j] + " ");
        }
        System.out.println();
    }
} else {
    for (int i = 0; i < R; i++) {
        for (int j = 0; j < C; j++) {
            System.out.print(transformed[i][j] + " ");
        }
        for (int j = 0; j < MC; j++) {
            System.out.print(second[i][j] + " ");
        }
        System.out.println();
    }
}

```

```
}  
}  
}
```

**Status :** Correct

**Marks :** 10/10

#### 4. Problem Statement

Nikila is working as an intern in a software firm and is practicing with a matrix where each row represents a set of numerical values. Her task is to identify the row with the highest sum of its elements and remove that row from the matrix. After removing the row with the highest sum, Nikila needs to print the updated matrix.

Your task is to help Nikila in implementing the same. If there are two or more rows that have same the highest sum, the firstly encountered row is deleted.

##### ***Input Format***

The first line of the input consists of two space-separated integers, R and C, representing the number of rows and columns in the matrix, respectively.

The following R lines each contain, C space-separated integers representing the matrix elements.

##### ***Output Format***

The output prints the matrix after removing the row with the highest sum. Each row should be printed on a new line, with elements separated by a space.

Refer to the sample output for the formatting specifications.

##### ***Sample Test Case***

Input: 2 2

1 2

3 4

Output: 1 2

### Answer

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int R = sc.nextInt();
        int C = sc.nextInt();
        int[][] matrix = new int[R][C];
        for (int i = 0; i < R; i++) {
            for (int j = 0; j < C; j++) {
                matrix[i][j] = sc.nextInt();
            }
        }
        int maxSum = Integer.MIN_VALUE;
        int rowToRemove = 0;
        for (int i = 0; i < R; i++) {
            int sum = 0;
            for (int j = 0; j < C; j++) {
                sum += matrix[i][j];
            }
            if (sum > maxSum) {
                maxSum = sum;
                rowToRemove = i;
            }
        }
        for (int i = 0; i < R; i++) {
            if (i == rowToRemove) continue;
            for (int j = 0; j < C; j++) {
                System.out.print(matrix[i][j]);
                if (j != C - 1) System.out.print(" ");
            }
            System.out.println();
        }
        sc.close();
    }
}
```
